SUMMARY

Full-stack engineer building ML-driven and decentralized applications end to end — from federated learning pipelines and vector-search systems to blockchain-backed health record platforms. Experienced with Python, TensorFlow, React.js, Node.js, and Solidity, with a focus on performance-critical, privacy-conscious systems. Strong algorithmic foundation with 200+ problems solved on LeetCode.

EDUCATION

Dr. A.P.J. Abdul Kalam Technical University — Lucknow, Uttar Pradesh
Bachelor of Technology in Computer Science and Engineering | 2023 – 2027

TECHNICAL SKILLS

- Languages: Python, JavaScript, Solidity, SQL, C++
- Python Libraries: NumPy, Pandas, OpenCV, Scikit-learn
- Machine Learning: TensorFlow, XGBoost, Random Forest, Neural Networks, ResNet-50, FAISS, Federated Learning
- Web/API Development: React.js, Node.js, Express.js, FastAPI, REST APIs, WebSockets
- Automation & Testing: Selenium, Playwright
- Blockchain/Web3: Solidity, Web3.js, IPFS, Smart Contracts
- Databases: MongoDB
- Tools & Platforms: Git, GitHub, Docker, Render, VS Code
- Core CS: Data Structures & Algorithms, OOP, DBMS, Operating Systems, Computer Networks

WORK EXPERIENCE

Freelance Software Engineer — Olympus Project, Shipd.ai | October 2025 – Present

- Contracted to source, reproduce, and resolve real-world bugs and feature requests from high-traffic open-source repositories (500K+ GitHub stars), compensated per accepted submission.
- Submitted 8 issue resolutions across multiple repositories, with 4+ accepted after technical review — validating correctness, reproducibility, and fix quality.
- Containerized isolated, fully offline reproduction environments per repository by authoring custom Dockerfiles resolving all dependencies.
- Authored test.patch files that deterministically reproduce each reported issue, validating the failure condition before any fix was applied.
- Developed verified solution.patch files resolving the underlying bug or implementing the requested enhancement, executing the full pipeline in Python.

PROJECTS

Health-AI | Python, TensorFlow, Federated Learning, REST, WebSockets | December 2025 - Present

[GitHub](#)

- Designed a multi-model ensemble (Random Forest, XGBoost, Neural Networks) for medical risk stratification and emergency prediction.
- Built a federated learning pipeline enabling model training across distributed nodes without centralizing patient data, aligning with HIPAA/GDPR privacy principles.
- Connected real-time AI inference to IoT medical sensors via REST APIs and WebSockets, enabling continuous, low-latency health monitoring.

SearchLens — Visual Search Engine | Python, TensorFlow, ResNet-50, FAISS, React.js | October 2024 - January 2026

[GitHub](#) | [Live Demo](#)

- Built a visual similarity search engine using ResNet-50 embeddings and FAISS indexing, achieving 92% accuracy with sub-200ms average query response time.
- Built the image preprocessing and embedding pipeline, extracting feature vectors from 1,000+ images using a pretrained ResNet-50 backbone.
- Deployed a full-stack app with a React frontend, taking the system from model to a live, publicly accessible product.

CareVault — Decentralized Health Record System | React.js, Solidity, IPFS, Node.js | March 2025 - Present

[GitHub](#)

- Architected a decentralized health record system using React.js, Solidity smart contracts, and IPFS for tamper-resistant, patient-owned data storage.
- Built an end-to-end integration layer with Node.js and Web3.js, connecting the patient-facing frontend to blockchain-based record storage and retrieval.
- Designed data access patterns to support concurrent multi-user reads/writes without performance degradation.
